CS23336-Introduction to Python Programming

Started on W	eanesaay, 18	September	2024,	1:42 PM	

State Finished

Completed on Wednesday, 18 September 2024, 2:48 PM

Time taken 1 hour 6 mins Marks 10.00/10.00

> Grade **100.00** out of 100.00

Question 1
Correct Mark 1.00 out of 1.00 □ Flag question
Question text
Write a Python program to get one string and reverses a string. The input string is given as an array of characters char[].
You may assume all the characters consist of printable ascii characters. Example 1:
<pre>Input: hello Output: olleh</pre>
Example 2:
Input: Hannah

Answer:(penalty regime: 0 %)

Output: hannaH

a=input() b=a[::-1] print(b)

Feedback

Input Expected Got

olleh hello olleh

Hannah hannaH hannaH

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 2

Correct Mark 1.00 out of 1.00 $\square^{\mathbb{P}}$ Flag question

Question text

Given a string s containing just the characters $'(', ')', '\{', '\}', '[' \text{ and '}]', \text{ determine if the input string is valid.}$

An input string is valid if:

Open brackets must be closed by the same type of brackets.

Result

Open brackets must be closed in the correct order.

Constraints:

```
1 \le \text{s.length} \le 10^4
```

s consists of parentheses only $'()[]{}'.$

Test

For example:

```
print(ValidParenthesis("()"))
                                 true
print(ValidParenthesis("()[]{}")) true
print(ValidParenthesis("(]"))
                                 false
Answer:(penalty regime: 0 %)
                 def
                 ValidParenthesis(s):
                   st=[]
                   m=
                 {')':'(','}':'{',']':'['}
                   for char in s:
                      if char in
                 m.values():
                 st.append(char)
                      elif char in m:
                         if not st or
                 st[-1]!=m[char]:
                            return 'false'
                         st.pop()
                   return 'true' if not st
                 else 'false'
Reset answer
```

Feedback

Test	Expected	Got
<pre>print(ValidParenthesis("()"))</pre>	true	true
<pre>print(ValidParenthesis("()[]{}"))</pre>	true	true
<pre>print(ValidParenthesis("(]"))</pre>	false	false

```
Correct
Marks for this submission: 1.00/1.00.
Question 3
Correct
Mark 1.00 out of 1.00
\square Flag question
Question text
Assume that the given string has enough memory.
Don't use any extra space(IN-PLACE)
Sample Input 1
a2b4c6
Sample Output 1
aabbbbcccccc
Answer:(penalty regime: 0 %)
def ds(a):
   result=[]
  i=0
  while i<len(a):
     char = a[i]
     count=""
     i+=1
```

Passed all tests!

Feedback

a=input() x=ds(a) print(x)

while i<len(a)

count+=a[i]

and a[i].isdigit():

i+=1 ct=int(count)

result.append(char*ct) return ".join(result)

Input	Expected	Got
a2b4c6	aabbbbcccccc	aabbbbcccccc
a12b3d4	aaaaaaaaaaabbbdddd	aaaaaaaaaaabbbdddd
Passed	all tests!	

Marks for this submission: 1.00/1.00.

Question 4

Correct

Correct Mark 1.00 out of 1.00 \square Flag question **Question text** Find if a String2 is substring of String1. If it is, return the index of the first occurrence. else return -1. Sample Input 1 thistest123string 123 **Sample Output 1** 8 Answer:(penalty regime: 0 %) def sss(s1,s2): index=s1.find(s2) return index s1=input() s2=input() result=sss(s1,s2) print(result) **Feedback Expected Got** Input thistest123string 8 8 Passed all tests! Correct Marks for this submission: 1.00/1.00. **Question 5** Correct Mark 1.00 out of 1.00 \square Flag question **Question text** Given a **non-empty** string s and an abbreviation abbr, return whether the string matches with the given abbreviation.

A string such as "word" contains only the following valid abbreviations:

```
["word", "1ord", "w1rd", "wo1d", "wor1", "2rd", "w2d", "wo2", "1o1d", "1or1", "w1r1", "1o2", "2r1", "3d", "w3", "4"]
```

Notice that only the above abbreviations are valid abbreviations of the string "word". Any other string is not a valid abbreviation of "word".

Note:
Assume s contains only lowercase letters and abbr contains only lowercase letters and digits.
Example 1:
Input
internationalization
i12iz4n
Output
true
Explanation
Given $\mathbf{s}=$ "internationalization", $\mathbf{abbr}=$ "i12iz4n":
Return true.
Example 2:
Input
apple
a2e
Output
false
Explanation
Given \mathbf{s} = "apple", \mathbf{abbr} = "a2e":
Return false.
Answer:(penalty regime: 0 %)

```
def vwa(s,abbr):
  i,j=0,0
  while i<len(s) and
j<len(abbr):
abbr[j].isdigit():
       if
abbr[j]=='0':
          return
False
       num=0
       while
i<len(abbr) and
abbr[j].isdigit():
num=num*10+int(a
bbr[j])
          j+=1
```

Feedback

i12iz4n

Input Expected Got internationalization true true

apple false false

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 6

Correct Mark 1.00 out of 1.00 \square Flag question

Question text

Consider the below words as key words and check the given input is key word or not.

keywords: {break, case, continue, default, defer, else, for, func, goto, if, map, range, return, struct, type, var}

Input format:

Take string as an input from stdin.

Output format:

Print the word is key word or not.

Example Input:

break

Output:

break is a keyword

Example Input:

IF

Output:

IF is not a keyword

For example:

IF IF is not a keyword Answer:(penalty regime: 0 %) a=input() x= ['break','case','continu e','default','defer','else ','for','func','goto','if',' map','range','return','s '] if a in x: print(f"{a} is a keyword") else: print(f"{a} is not a keyword")

Result

Feedback

Input

Input Expected Got

break break is a keyword break is a keyword

IF IF is not a keyword IF is not a keyword

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 7

Correct Mark 1.00 out of 1.00 \square Flag question

Question text

Given a string, determine if it is a palindrome, considering only alphanumeric characters and ignoring cases.

Note: For the purpose of this problem, we define empty string as valid palindrome.

Example 1:

```
Input:
A man, a plan, a canal: Panama
Output:
1
```

Example 2:

```
Input:
race a car

Output:
0
```

Constraints:

• s consists only of printable ASCII characters.

```
Answer:(penalty regime: 0 %)

def palin(s):

filter=".join(char.lowe r()for char in s if char.isalnum())

if filter==filter[::-1]:

print("1")
else:
print("0")
s=input()
palin(s)
```

Feedback

	ln	put		Expected	Got
A man,	a plan,	a canal:	Panama	1	1
race a	car			0	0

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 8

Correct Mark 1.00 out of 1.00 \square Flag question

Question text

Given a string S which is of the format USERNAME@DOMAIN.EXTENSION, the program must print the EXTENSION, DOMAIN, USERNAME in the reverse order.

Input Format:

The first line contains S.

Output Format:

The first line contains EXTENSION. The second line contains DOMAIN. The third line contains USERNAME.

Boundary Condition:

1 <= Length of S <= 100

Example Input/Output 1:

Input:

abcd@gmail.com

Output:

com gmail

abcd

For example:

Input

```
edu.in
arvijayakumar@rajalakshmi.edu.in rajalakshmi
arvijayakumar

Answer:(penalty regime: 0 %)

a=input()
un,domain=a.split('@')
dp=domain.split('.')
if len(dp)>=2:
    dn=dp[0]
    de='.'.join(dp[1:])
print(de)
print(dn)
print(un)
```

Result

Feedback

Input	Expected	Got
abcd@gmail.com	•	com gmail abcd
arvijayakumar@rajalakshmi.edu.in	edu.in rajalakshmi arvijayakumar	edu.in rajalakshmi arvijayakumar

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 9

Correct Mark 1.00 out of 1.00 \square^{∇} Flag question

Question text

The program must accept N series of keystrokes as string values as the input. The character $^$ represents undo action to clear the last entered keystroke. The program must print the string typed after applying the undo operations as the output. If there are no characters in the string then print -1 as the output.

Boundary Condition(s):

```
1 \le N \le 100

1 \le Length of each string <= 100
```

Input Format:

The first line contains the integer N. The next N lines contain a string on each line.

Output Format:

The first N lines contain the string after applying the undo operations.

Example Input/Output 1:

```
Input:
```

```
3
Hey ^ goooo^^glee^
lucke^y ^charr^ms
ora^^nge^^^^
```

Output:

Hey google luckycharms -1

```
Answer:(penalty regime: 0 %)
def pk(N,ks):
   results=[]
   for keystroke in
ks:
     stack=[]
     for char in
keystroke:
        if char==
١٨١:
          if stack:
stack.pop()
        else:
stack.append(char)
result=".join(stack)
if stack else'-1'
```

Feedback

Input Expected Got

```
3
Hey ^ goooo^^glee^ luckycharms luckycharms
ora^^nge^^^^ -1 -1
```

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

Question 10

Correct

Mark 1.00 out of 1.00 T Flag question Question text A pangram is a sentence where every letter of the English alphabet appears at least once. Given a string sentence containing only lowercase English letters, return true if sentence is a pangram, or false otherwise. Exampla 1: Input: true Explanation: sentence contains at least one of every letter of the English alphabet. Example 2: Input: arvijayakumar Output: false Constraints: 1 <= sentence.length <= 1000 sentence consists of lowercase English letters. For example: Test Result print(checkPangram(*thequickbrownfoxjumpsoverthelazydog*)) true print(checkPangram(*arvijayakumar*)) false Answer:(penalty regime: 0 %) import string def checkPangram(s): a=set(string.ascii_low ercase) b=set(clower() for c in sife.isalpha()) return 'true' if a <= b else 'false'
